

Ruth Lee Water Rescue Dummy Body Recovery, toddler, weight 10 kg, size 0.90 m, blue

Order number: AU-02047

The body recovery manikin was predominately designed to aid Police dive teams train to recover bodies from any inland waters or under ice.

The manikin is a variant of the popular Water Rescue manikin - but instead of floating, it sinks. The body recovery models are visible to sonar devices.

- anatomically correct weight distribution allows for realistic body 'bagging' as part of training exercises
- this manikin will easily withstand a fall of 5 - 6 metres into water with no damage
- constructed using a H/D reinforced Nylon mesh for the carcass and non-absorbent closed cell foam for buoyancy - mesh allows water to flood into the body to allow it to sink and out as it is being recovered
- mesh allows for ventilation when the manikin hung up to dry - a polypropylene loop to the back of the carcass allows the manikin to be lowered into position or hung up to dry
- the addition of a realistic face and a wig enable easier/quicker identification of the body in poor visibility when the search is by touch only
- polyethylene strips running from the shoulders to the knees allow flexibility but prevent the manikin from bending in half when using stretchers or recovery devices
- replaceable coveralls and boots are easily replaceable and greatly extend the life of the manikin

size: 0.90 m

weight: 10 kg
