

rescue-tec Emergency Backpack L, for Emergency Intervention Team

Order number: RD-07845

Large first-aid backpack specially developed for emergency intervention teams and operative use.

The rucksack is completely black on the outside and has three side pockets on the outside and a flat, attached front pocket. Two fleece strips are sewn onto the inside of the lid to attach two inner pockets 24 x 14 x 4.5 cm.

The large main compartment offers space for four inside pockets 25 x 11 x 8 cm, which are fixed with Velcro. In addition, there is space for an oxygen cylinder, which is fastened with straps.

The flat front pocket offers space for important documents. The large side pocket and the backpack front are equipped with sufficient MOLLE loops. The shoulder straps have loops for additional equipment.

The backpack is made of high-quality Cordura fabric. The fabric is extremely tear-resistant and easy to clean. It has a water-, oil- and dirt-repellent impregnation and dispersion coating. YKK's two-way zippers allow the rucksack to be opened and closed easily and quickly. For better handling, especially when wearing gloves, all sliders are equipped with zipper extensions.

The padded back and extra long adjustable shoulder straps provide high wearing comfort. The extended and adjustable chest and hip straps also increase wearing comfort and allow wearing even when body protection is on.

A fleece strip is sewn onto the front for individual identification by means of a reflective label (150 x 50 mm).
