dimensions: 20 x 19 x 5 cm

total weight: 630 g

rescue-tec holster Osnabruck

It is possible to accommodate on the rescuer himself all the tools required directly at the accident site in this holster, such as a crow bar, valve removing device etc. It can be fixed to a normal leather waist belt, on a hip belt consisting of respiratory equipment, on a fireman's safety belt and on the Molle-system.

material: Cordura

lever 8 inch

The implementation of small levers work, especially for the removal of interior panels for the identification of problem areas within the cutting area (such as gas generators).

double end wrench 10 x 13

For disconnecting of batteries.

pocket tape, 3 m

Use the tape to mark length of the spreader and rams. You can directly see which tool is the right one.

pin remover

Special tool for undoing the inner paneling of vehicles of any type. The specially designed tip engages beneath the clips that are used to attach the paneling. The clips can then be easily removed by means of the levering effect. Indispensable during rescue operations involving vehicle accidents.

**spin valve for tires**

Use the spin valve to empty the tires of a vehicle after bringing the vehicle safely to the base. The destruction of the tires that may be to determine the cause of the accident of importance is to be avoided.

special glass punch

Hardened, automatic special spring centre punch for opening side or rear windows. Single-handed operation: just position and push!

permanent marker, colour red

In case of assistance after accident it can be used to sign the cutting site. The marker serves for signing especially on dark, rough and dirty surfaces. It writes like chalk but with a viscous, opaque paste, which dries up lightfast, water- and scratch-resistant after a short period.

Partially the pictures show filling samples.
