

# Aviation Oxygen Systems Bag ID-54

for portable oxygen supply in cargo airplanes

**irt**rescuetec

The transport bag has been developed for emergency oxygen supply of flight personnel on cargo airplanes.

Live cargo, such as horses and pets are regularly checked and cared for by flight personnel. It is required to carry an oxygen supply and breathing mask to be able to quickly react to a sudden cabin depressurisation.

In a close cooperation with a large cargo airline, this bag by rescue-tec has been developed for storage and transport of the mobile emergency oxygen supply in cargo airplanes.

This bag has the advantage, that it lets you simply and easily carry the 2 litres pressure container and breathing mask where your hands remain free through the backpack carrying system.

The pressure container is well protected from external forces through the stable design of the bag.

material: fire retardant  
size: 23 x 79 x 17 cm  
weight 3.99 kg

Enables quick check as part of the flight check by sealing of the bag – undetected opening not possible!

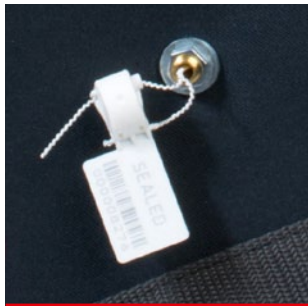

**P/N : ID-54**

Article- or inventory number for rapid identification.

Interconnected double zips for quick opening in case of emergency.

Oxygen level indicator visible from the outside of the bag.

Inspection seal of the pressure container visible from the outside of the bag.

Additional fixation of the pressure container through straps.

Adjustable backpack carrying straps.

Aluminium core with padding for protection against mechanical impact.
